Background of Study

Globally, many young adults grapple with both identified and unidentified mental health challenges. In Malaysia, an estimated 29.2% of the population is affected by mental disorders, with 11.0% of adolescents reporting symptoms of severe depression. Despite this high prevalence, help-seeking rates remain low, and many psychiatric conditions go untreated until they reach advanced stages. This trend is influenced by multiple factors, including lack of awareness, cultural beliefs, and pervasive stigma associated with mental illness. Although initiatives such as the Healthy Mind Program have been introduced in schools to support prevention, recovery, and crisis management, disparities in implementation and accessibility persist. These findings highlight the urgent need for enhanced, adolescent-focused mental health support systems, alongside increased collaboration across sectors to promote early intervention and improve access to care.

Objective

To investigate the barriers and facilitators influencing secondary school students' access to mental health services by examining the interplay between their awareness of available mental health services, knowledge on mental health and attitudes towards accessing these services.

Perceived Barriers in Accessing Mental Health Services Among Respondents

It is difficult for me to share my problems with strangers, even if they are a counsellor/psychologist/psychiatrist/doctor.

I do not want to seek mental health services because it is not a common practice in my life.

I worry about being labelled as "problematic" if I seek help from a counsellor/psychologist/psychiatrist/doctor.

I worry that the counsellor/psychologist/psychiatrist/doctor will not be sensitive to my problems.

I feel ashamed to tell my mental health problems to a counsellor/psychologist/psychiatrist/doctor.

My family discourages me from seeing a counsellor/psychologist/psychiatrist/doctor for mental health assistance.

I am not concerned about others' opinions of me if I seek mental health services.

My friends will distance themselves from me if they know I am seeking help from a counsellor/psychologist/psychiatrist/doctor.

I do not know how to contact a counsellor/psychologist/psychiatrist/doctor who provides mental health services.

Teachers will look down on me if I see a counsellor/psychologist/psychiatrist/doctor.

I refuse to share personal information about my problems when meeting with a counsellor/psychologist/psychiatrist/doctor.

I will not be given any post in school if I have mental health problems. (example: prefect/President etc)

I would feel inferior if I told my problems to a counsellor/psychologist/psychiatrist/doctor.

I worry that my personal problems will be known by friends and teachers if I seek help from a counsellor/psychologist/psychiatrist/doctor.

I worry that the counsellor/psychologist/psychiatrist/doctor will not understand me.

Facilitating Factors in Accessing Mental Health Services Among Respondents

I am confident that support from a counsellor/psychologist/psychiatrist/doctor can help detect mental health issues.

The school encourages me to seek mental health services from a counsellor if needed.

I have a positive attitude towards seeking mental health services if needed.

I feel comfortable sharing mental health issues with a counsellor/psychologist/psychiatrist/doctor if needed.

I know how to access counselling services related to mental health issues if needed.

I know the school counsellor to seek mental health services if needed.

The experience of family members or peers who have received mental health services increases my confidence in seeking help if needed.

Information about mental health from social media helps me to seek mental health services if needed.

My family supports me in seeking mental health services if needed.

Conclusion

While Malaysian secondary school students demonstrate adequate knowledge of mental health, their attitudes toward it remain a concern. Internal barriers, particularly self-stigma, play a more significant role than external factors in preventing students from accessing mental health services. Despite their awareness, many students lack the confidence to seek help when needed. However, the study found that family members, friends, and teachers serve as vital support systems for students facing mental health challenges. Students tend to confide in these trusted individuals rather than turning to external resources, as these established relationships offer a safe, judgment-free space to express their concerns.

Recommendation

The mental health initiatives for Malaysian schools, jointly managed by the Ministry of Health and the Ministry of Education, should adopt a comprehensive and practical approach. Strategic initiatives include leveraging social media through edufluencers, integrating mental health modules into the school curriculum, strengthening peer support systems, and providing continuous professional development for teachers. The strategy also highlights on-the-ground implementation strategies such as expanding the Minda Sihat program, organizing mental health carnivals, developing student-friendly mobile applications, and establishing school adoption programs to foster supportive environments. Overall, the recommendations prioritize creating safe and inclusive spaces for open discussions, enhancing access to mental health support, and promoting collaboration among key stakeholders to ensure the well-being of students across Malaysia.
